Hypermature Intumescent White Cataract

- Cortical mature cataract has opaque, milky, white (potentially) liquified cortex
- Hydration of the lens cortex
- Cortical fibers become swollen and milky white
- Either traumatic rent in the capsule or aqueous imbibed through the ordinarily semipermeable lens capsule
- Lens swells, inducing increased endocapsular pressure
- Capsular stretch

*Masket S, in: Complications in Phacoemulsification
Fishkind WJ, Ed. Thieme, New York Stuttgart, 2002*

Hypermature White Cataract

Capsulorrhexis

- Capsule puncture is critical:
 1. High intracapsular pressure
 2. After puncture, liquified cortex may escape and mix with the aqueous
 3. Increase in pressure is anterior and posterior to the nucleus, and that leads to an endocapsular nuclear block

*Masket S, in: Complications in Phacoemulsification
Fishkind WJ, Ed. Thieme, New York Stuttgart, 2002*

Chakrabarti A, Journal of Cataract and Refract Surg, 2000

Hypermature White Cataract

Capsulorrhexis

3. Lens content will follow the pressure gradient, both anteriorly and posteriorly
4. Capsule may be very **friable** and may readily explode, **tearing to the equator** because of its stretch
5. Tear will run also on posterior capsule: **Argentinian flag sign**
 - Incomplete capsulorrhexis in 28.3% of cases

*Chakrabarti A, Journal of Cataract and Refract Surg, 2000
Osher, RH, AAO DVD series – Complications during cataract surgery*

AC, Giant Retinal Tear

- 40 y.o. white male
- High myopia
- Previous LASIK, OU
- Giant retinal tear on 09/2009, macula on
- VA 20/50 -3.25 -1.25 (155)
- TPPV, silicone oil
- 360° laser barrage
- Silicone oil removal on 03/2010...
- Totally white cataract developed: 11/2010 VA 20/100

White Intumescent Cataract: Surgical Strategy

- Anterior capsulorrhesis is the most challenging aspect of the surgery
- Slightly longer tunnel
- Carefully pressurize the eye
(cohesive OVD, i.e., Healon 5)
- Capsule needs to be stained
- Carefully puncture the anterior capsule
- Aspirate immediately fluid if leaks
- CCO

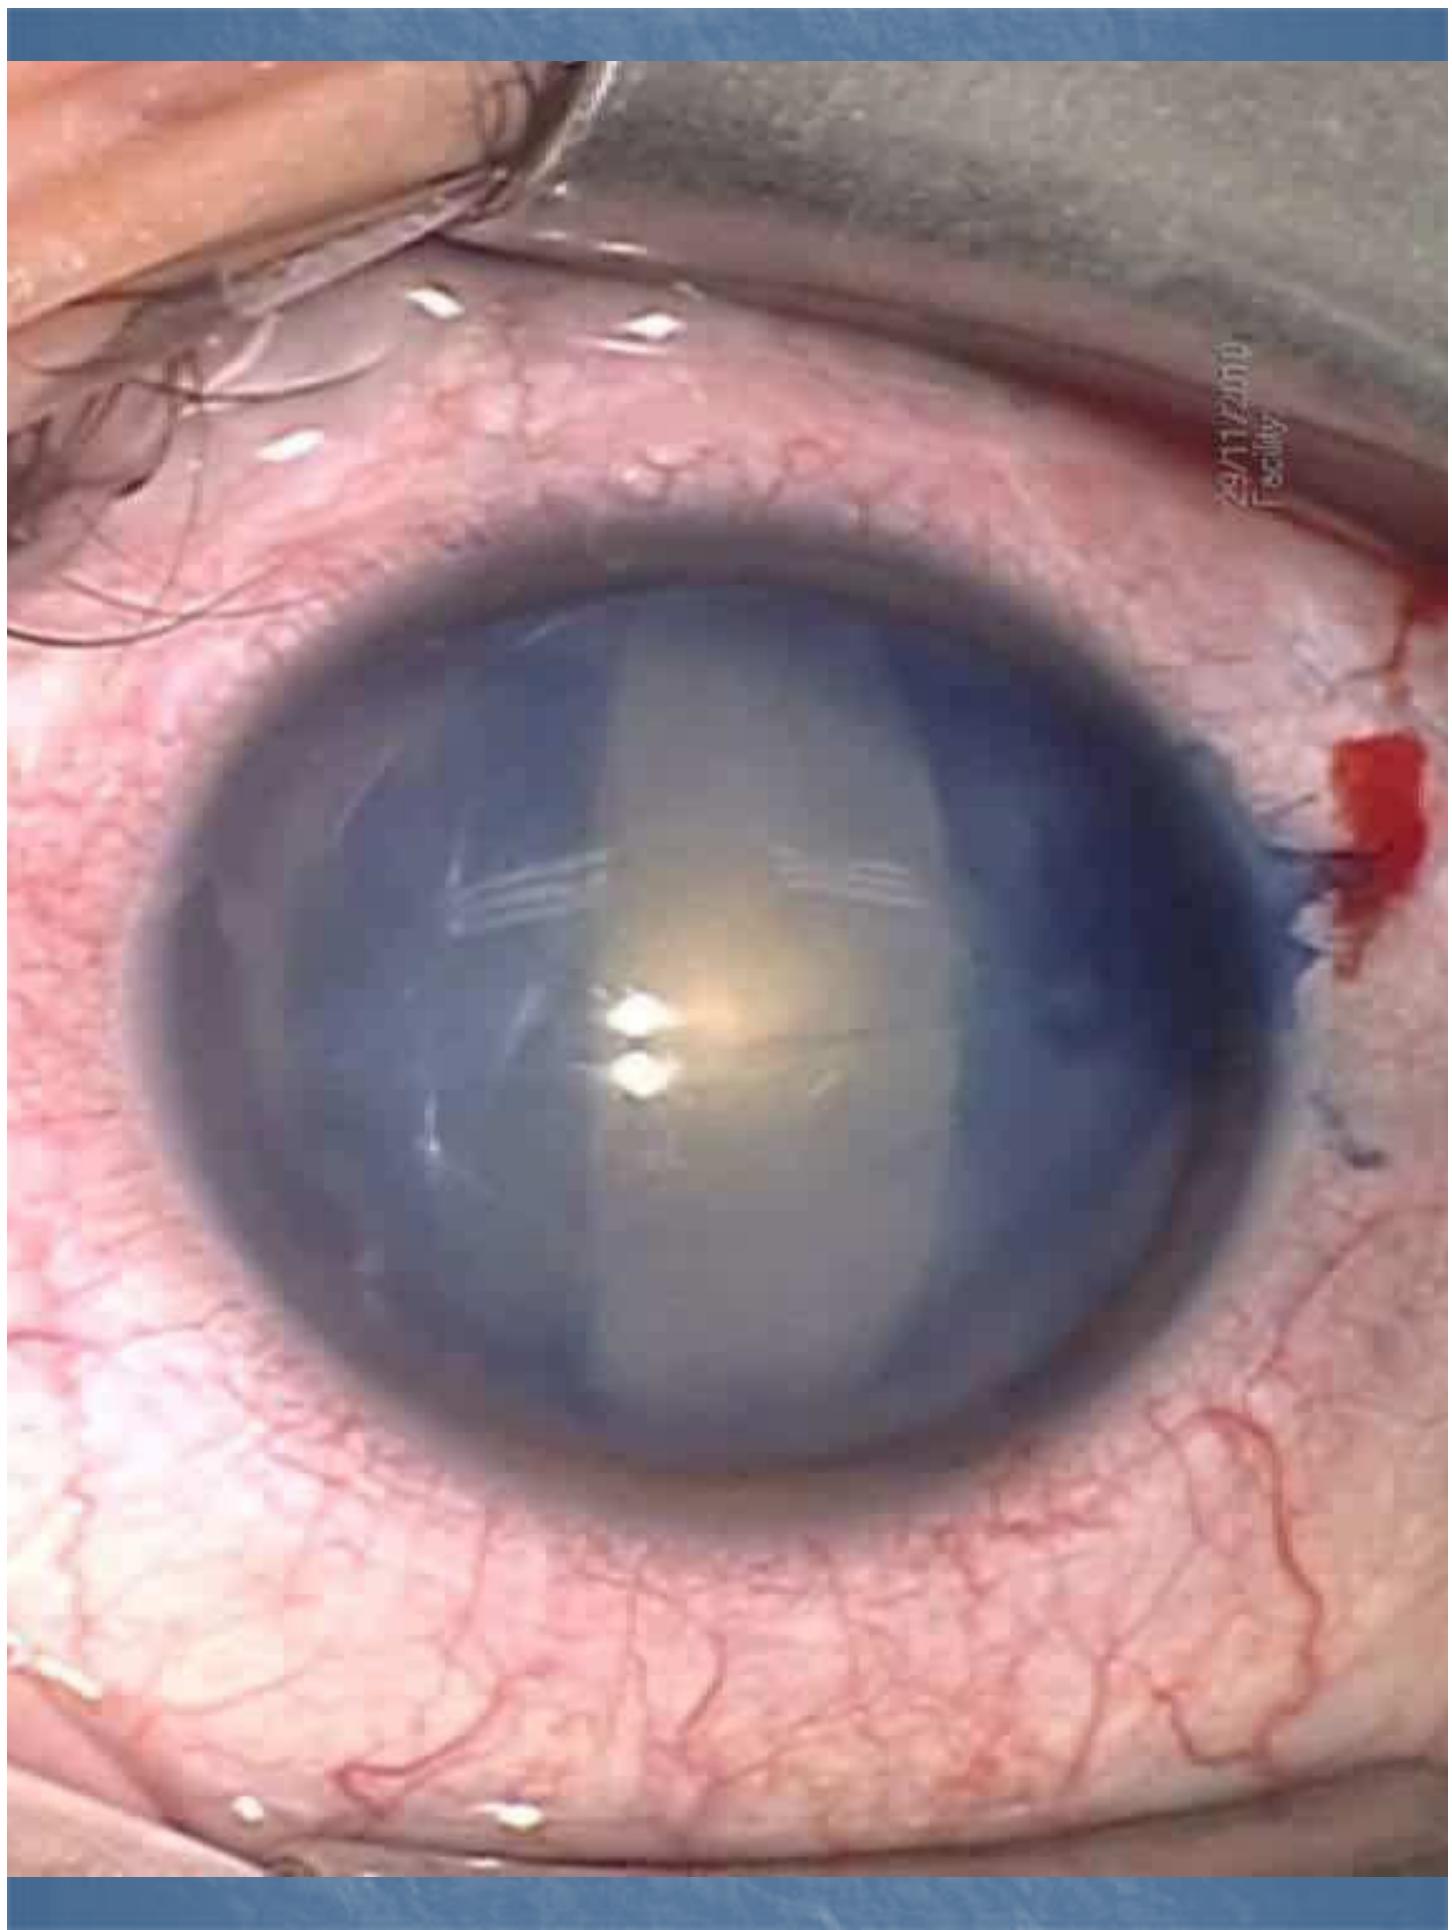

*Maskit S, in: Complications in Phacoemulsification
Fishkind WJ, Ed. Thieme, New York Stuttgart, 2002*

*Chakrabarti A, Journal of Cataract and Refract Surg, 2000
Arshinoff, Steve A, in: Curbside Consultation in Cataract Surgery
Chang DF, Ed. Slack Inc., Thorofare, NJ, 2007*

My Patient

- No vitreous, reduced posterior pressure
- Longer tunnel
- Pressurized with Viscoat
- Trypan blue
- Careful 30 G needle puncture in the middle of the capsule, ready to aspirate and...

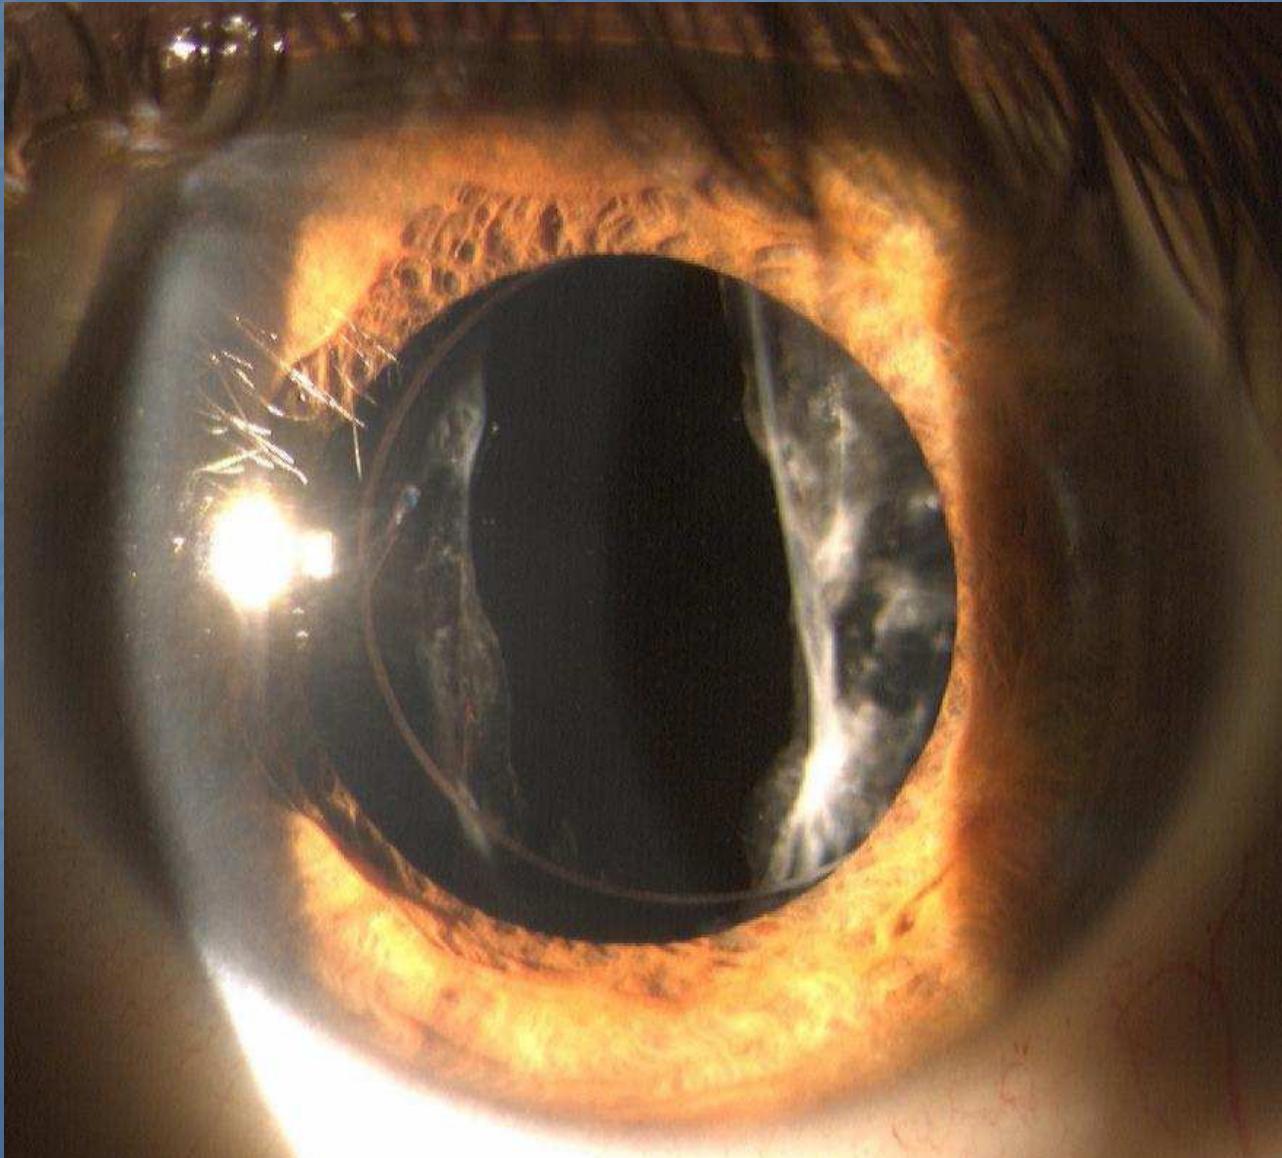

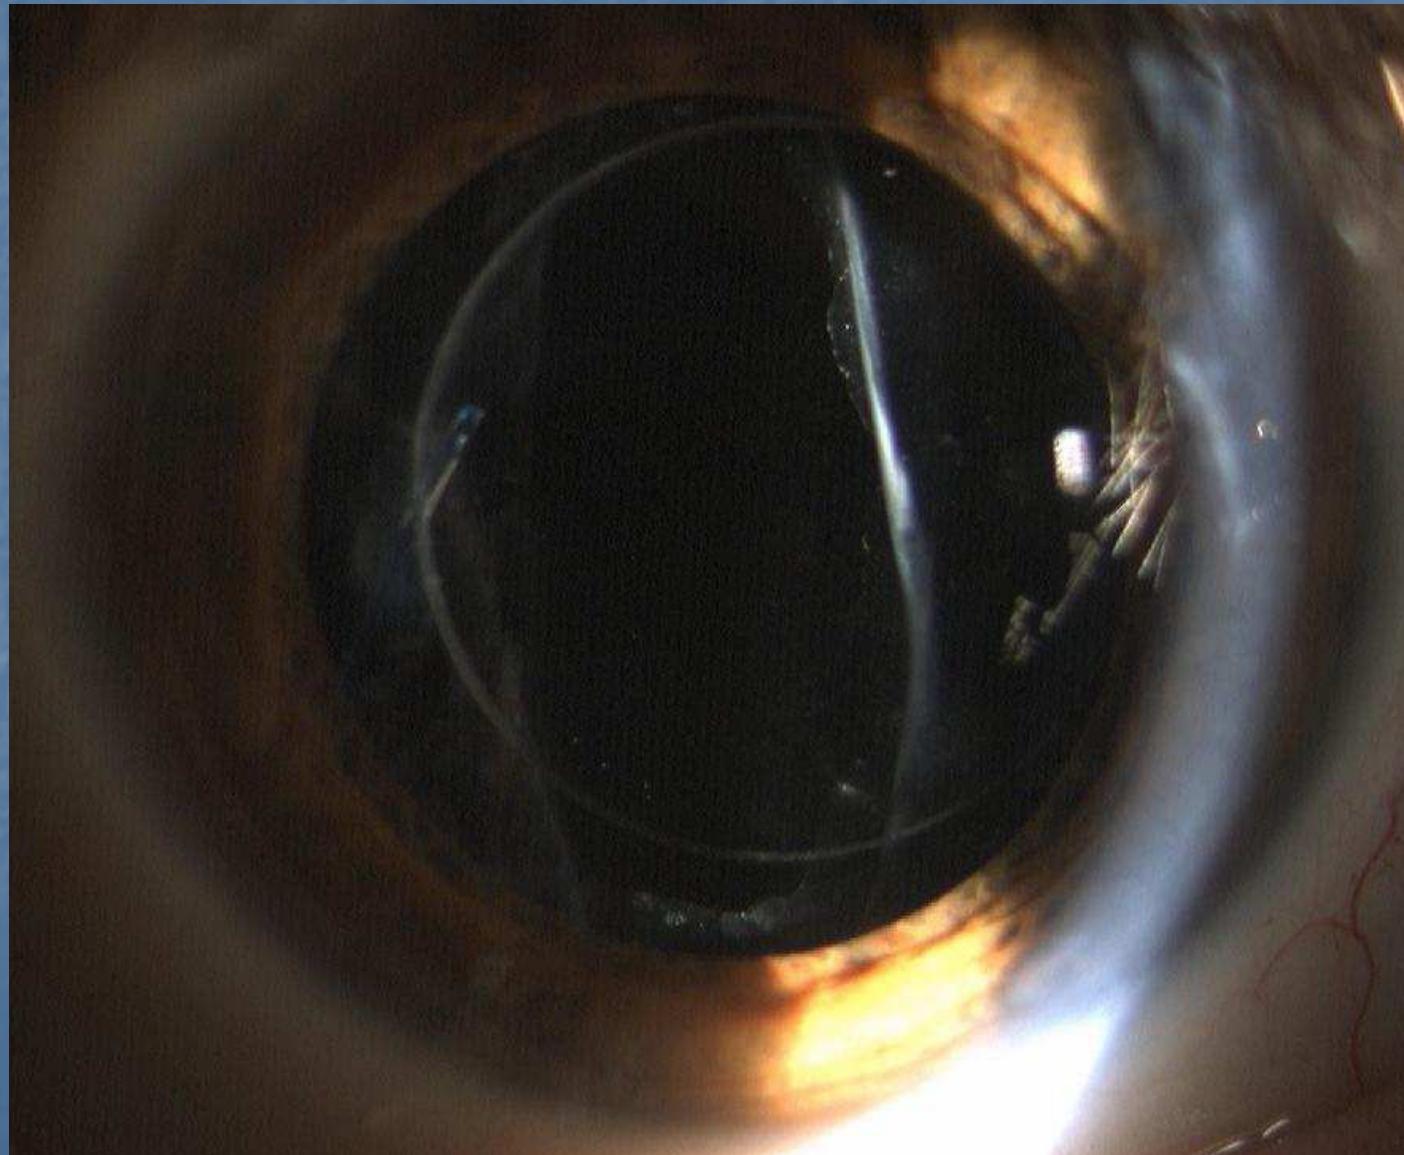

IOL

- + 14.00 D SA60AT converted to +14.50 MA60AC
- Haptics placed in the sulcus
- In the area of possible greater zonular resistance
- VA 20/40 -1.00
- And... the patient, six months later, wants to run !
- Two-month interval anterior segment photograph

6 Months Postop

8 Months Postop

Hypermature Intumescent White Cataract

Precautions

- Overfill the anterior chamber with cohesive OVD to flatten anterior capsule
- Relieve intracapsular pressure
 - Side port incision needle to puncture capsule, readily aspirate without decompressing anterior chamber
- *Tija KF, Cataract & Refractive Surgery Europe, Jul/Aug 2011*

Hypermature Intumescent White Cataract

Precautions

- If anterior chamber ruptures:
 - Lower the bottle
 - Remember that posterior capsule is broken as well
 - No hydrodissection
 - Remember that cortex is soft
 - Moderate fluidics setting
 - Three-piece IOL in the sulcus

Tija KF, Cataract & Refractive Surgery Europe, Jul/Aug 2011
